

SYNTHETIC TEST DATA. Invented patient, providers and facilities. Not a real medical record.

PATIENT: Rosalind Q. Marchetti
DOB: 1981-04-17
CLAIM: Marchetti v. Nordvale Freight Co. (demo)

2026-02-11 Cedar Hollow Emergency Center
Arrived by ambulance following a rear-end collision on Farm Road 12 at approximately 17:40. Restrained driver. Airbag deployed. Complains of neck pain radiating to the right shoulder, headache, and pain across the lower back.
Exam: cervical paraspinal tenderness, limited rotation to the right. No focal deficit.
Imaging: CT head without contrast, negative for acute intracranial process. Cervical spine x-ray, no acute fracture. Straightening of the normal cervical lordosis noted.
Assessment: cervical strain, lumbar strain, post-traumatic headache.
Plan: NSAIDs, muscle relaxant, follow up with primary care in one week.

2026-02-19 Dr. Amara Whitfield, DO, Whitfield Family Medicine
Follow-up. Neck pain 6/10, worse in the morning. Reports difficulty sleeping and missing four days of work. Range of motion reduced in rotation and lateral flexion bilaterally. Referred to physical therapy, three times weekly for six weeks.

2026-03-04 Lakeshore Physical Therapy
Initial evaluation. Cervical rotation 45 degrees right, 60 degrees left. Grip strength symmetric. Patient reports pain with prolonged sitting, which affects her work as a dispatcher.
Plan of care: 18 visits over six weeks.

2026-04-02 Dr. Amara Whitfield, DO
Interim visit. Improvement in the lumbar spine. Cervical symptoms persist with numbness into the right index and middle fingers. MRI of the cervical spine ordered.

2026-04-15 Northgate Imaging
MRI cervical spine without contrast. C5-C6 disc protrusion measuring 3mm with mild right-sided foraminal narrowing. No cord signal change. Degenerative changes noted at C6-C7 which appear chronic.

2026-05-06 Dr. Sanjay Oduya, MD, Northgate Orthopaedics
Consultation. History and MRI reviewed. Symptoms consistent with right C6 radiculopathy. Recommends epidural steroid injection. Discussed that the C6-C7 changes predate the collision and are unlikely to be traumatic in origin.

2026-05-28 Northgate Orthopaedics, procedure
Right C5-C6 transforaminal epidural steroid injection performed without complication.

2026-07-09 Dr. Sanjay Oduya, MD
Post-injection follow-up. Approximately 60 percent relief lasting six weeks. Radicular symptoms reduced. Continued home exercise recommended. Patient at maximum medical improvement for conservative care. Surgery not recommended at this time.
